This report is made subject to the conditions that it is confidential and may not be disclosed in whole or in part to others without the written consent of Smithers Pira

1 Objective

To assess any colour change and report on any change in the appearance of the print samples after exposure to artificial daylight. Conduct ΔE measurements at each Blue Wool stage and report on any colour shift.

2 Samples received

Samples received 18th May 2019 as detailed below:

- Dura-ID Laser Polyplas
- Dura-ID PP Laser (Perm)
- Dura-ID Polyolefin (BS5609)

Figure 1 – Samples received

3 Test methods

All materials were conditioned at $23 \pm 2^{\circ}\text{C}$, $50 \pm 5\%$ rh for a minimum of 24 hours prior to testing.

3.1 Colour fastness

The colour fastness of the print was determined using a Xenon Arc Light and Weather Fastness Tester in accordance with BS EN ISO 105-B02:1999.

Print areas of approximately 45mm x 135mm were exposed to accelerated, artificial sunlight in a Xenon Arc Light and Weather Fastness Tester. A set of blue wool reference standards was similarly exposed.

The lamp irradiance was set to $1.10 \text{ W/m}^2 \cdot \text{nm}$ at 420 nm and the insulated black panel temperature set at $47 \pm 3^{\circ}\text{C}$.

The samples measured for ΔE against an untested sample when they reached Blue Wool 3, 4, 5 and 6 (Grey Scale 4) using an X-rite eXact colour spectrophotometer (2mm aperture) and any observations reported.

The ΔE was measured on the 100% colour density section for each of the base colours (black, yellow, magenta and cyan).

Three replicates were tested.

4 Results

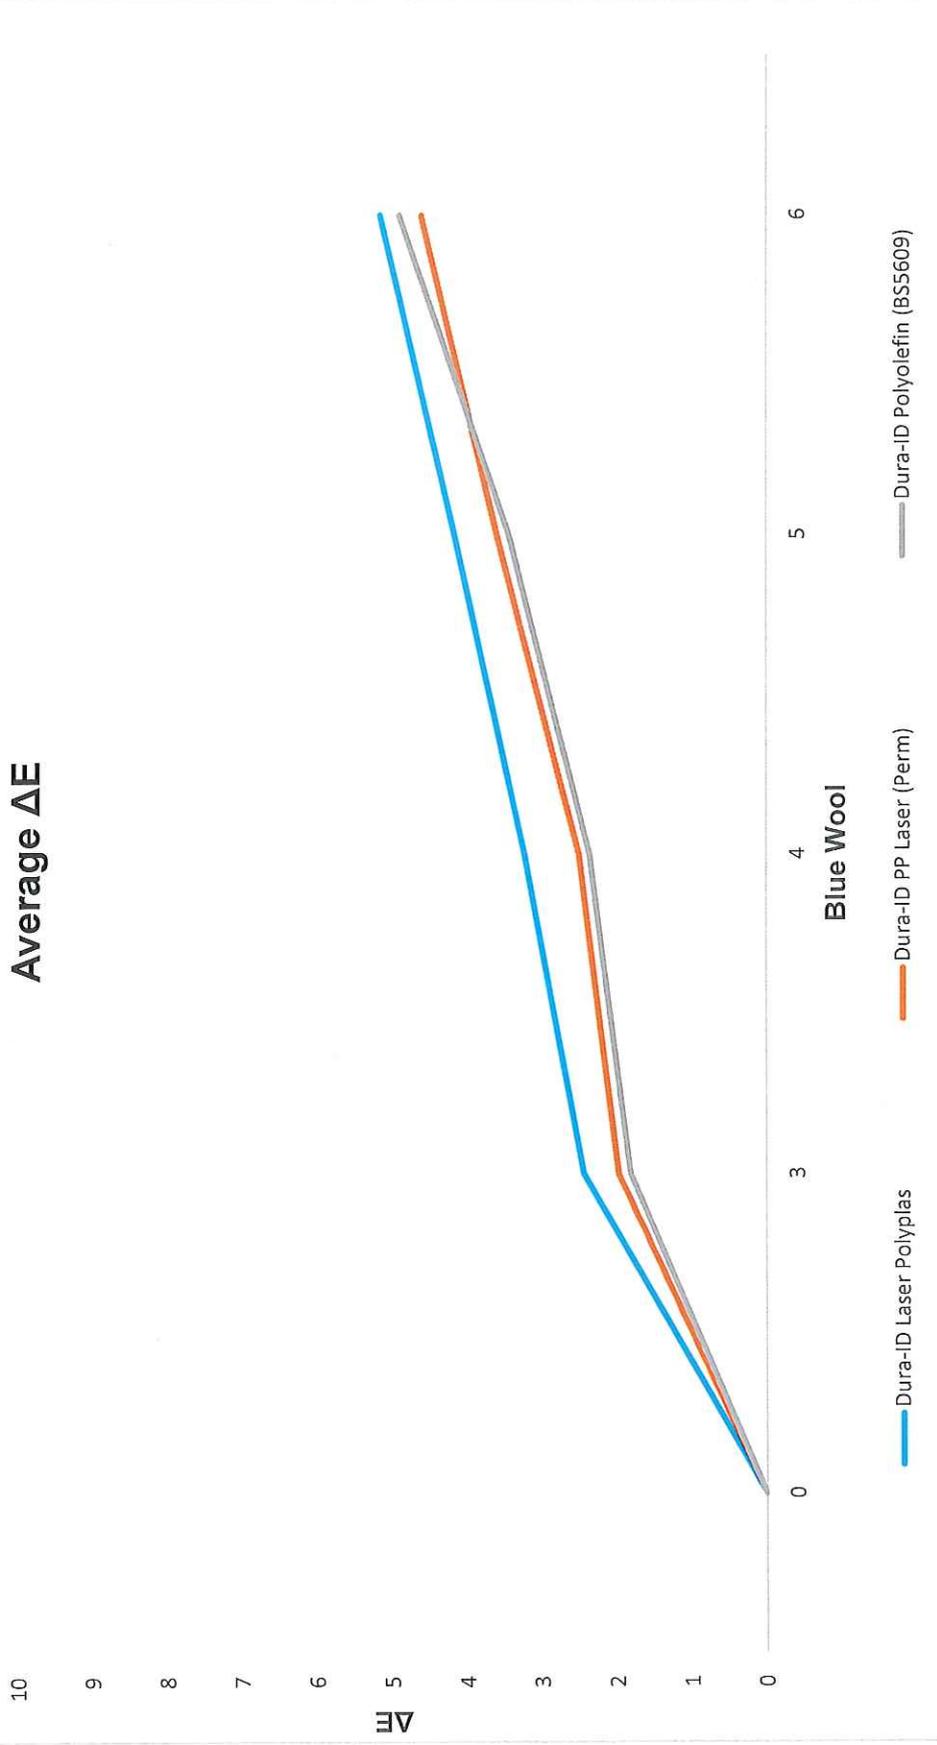

Table 1 and Graph 1 below detail the average of all ΔE measurements made on each sample type across all four colours measured (a lower ΔE value indicates better colour fastness).

Photographs of exposed and untested specimens as well as the raw data for the tables and graphs are included in the appendix to this report.

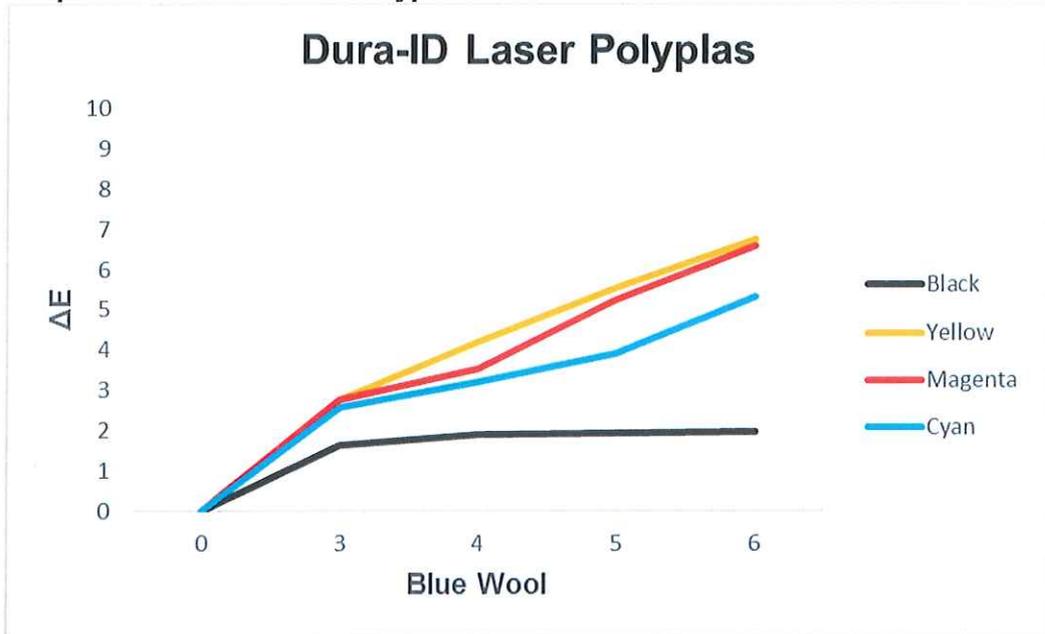

Table 1 – Average ΔE measurements

Sample	Average ΔE			
	BW3	BW4	BW5	BW6
Dura-ID Laser Polyplas	2.44	3.22	4.16	5.16
Dura-ID PP Laser (Perm)	1.97	2.50	3.60	4.61
Dura-ID Polyolefin (BS5609)	1.82	2.36	3.44	4.90

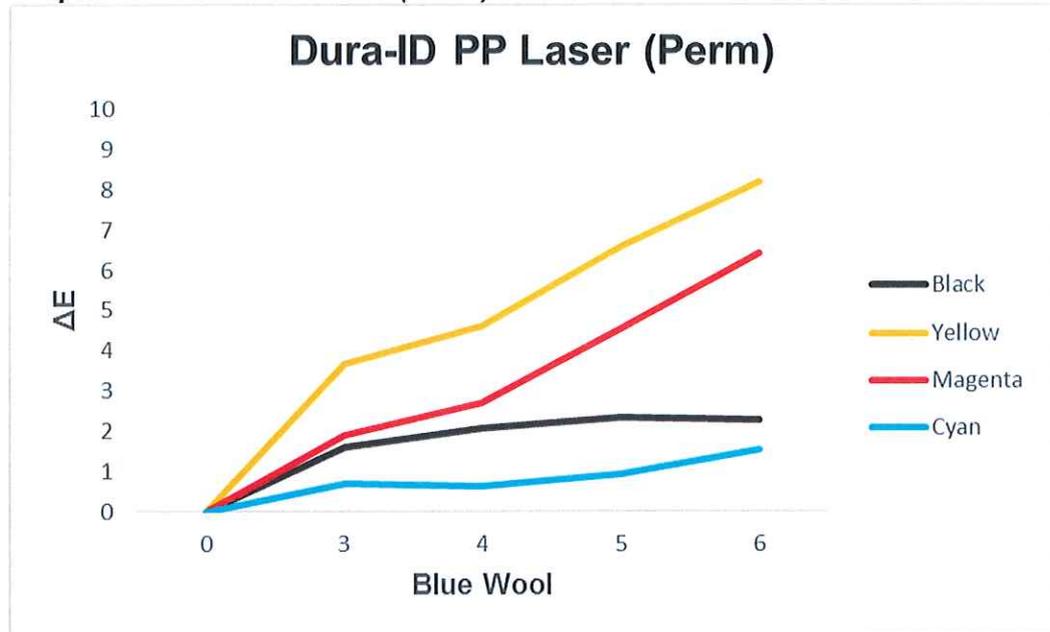

Graph 1 – Average ΔE measurements

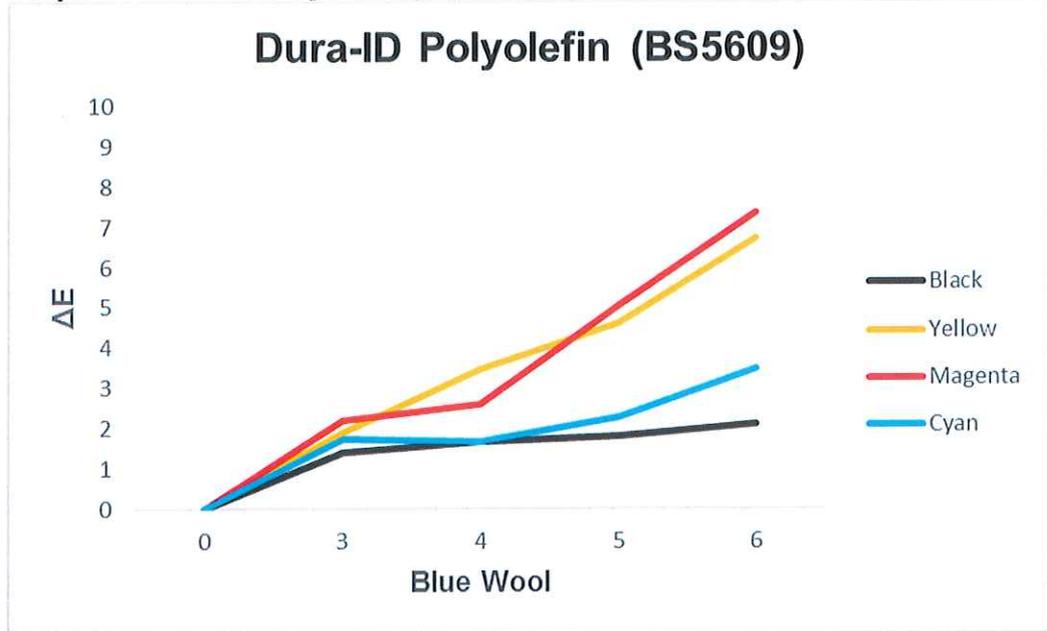

Graph 2 – Dura-ID Laser Polyplas ΔE measurements for each colour

Graph 3 – Dura-ID PP Laser (Perm) ΔE measurements for each colour

Graph 4 – Dura-ID Polyolefin (BS5609) ΔE measurements for each colour

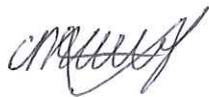

Graphs 2 to 4 above detail the ΔE measurement for the individual colours for each sample variant measured at Blue Wool 3, 4, 5 and 6 (at Grey Scale 4).

Table 2 below shows the sample variants ranked in order of average ΔE measured across all the colours sampled after Blue Wool 6 (Grey Scale 4) had been achieved (a lower ΔE value indicates better colour fastness).

Table 2 – Sample variants ranked best to worst for average ΔE at end of testing

Sample	Avg ΔE at BW6
Dura-ID PP Laser (Perm)	4.61
Dura-ID Polyolefin (BS5609)	4.90
Dura-ID Laser Polyplas	5.16
